Get all enroll (A)

Get one enroll (R)

Upload (U)

Delete (D)

Generate U-disk registration

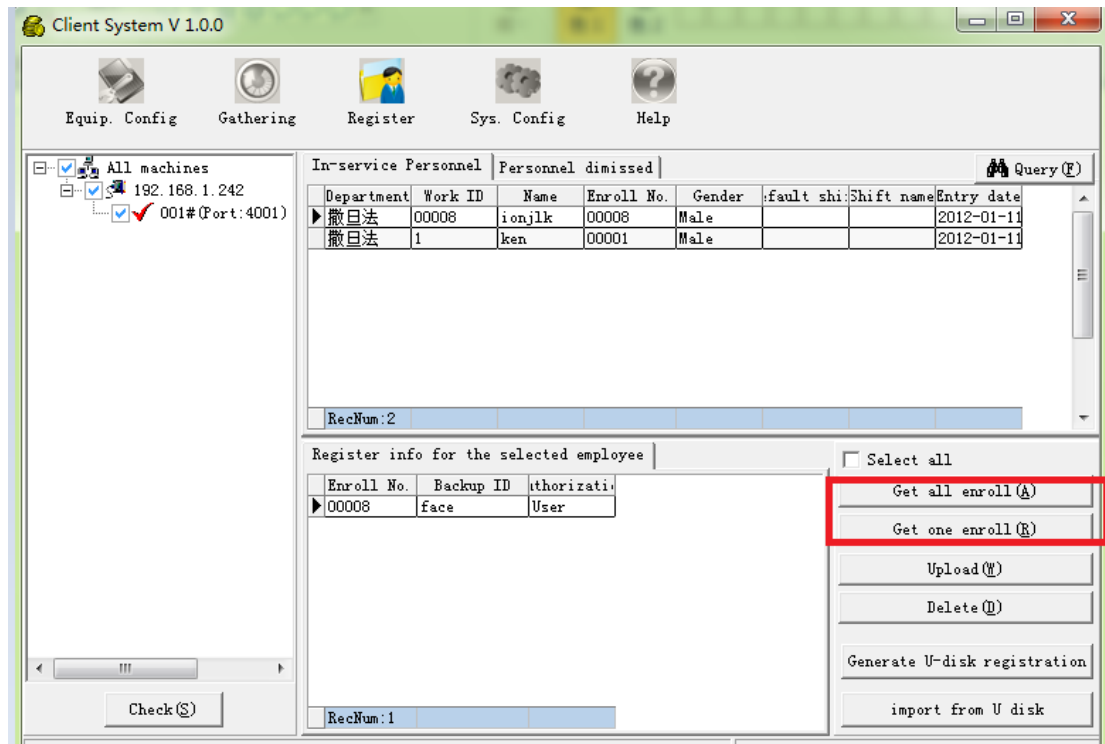

import from U disk

Check (S)

Then after upload finished, device could display user name.

Or we could realize it this way:

First we register user in the software , and please confirm the user id is the same, then get enroll data first

This is to associate device user enroll information with the register information in the software. After this step, we could upload user to device to renew the name information.

For your information, for the present firmware, only when device language is Chinese, device could support user name display, you could switch it to Chinese language to have a look at it, and you could see user name displayed at the bottom of the screen. The English Version firmware is under upgrading, we will send you new firmware to upgrade later. There is no problem to display user name in English, now we just display HELLO in the name area.
